

Campus events,

simplified.

A centralized event platform for clubs, students, organizers, and college administration.

THE CORE IDEA

Create once. Sell centrally. Issue a secure ticket. Check in fast. Track every rupee. Settle internally.

FINANCIAL BOUNDARY

03

WHATSAPP TICKETING

PRODUCT PRINCIPLE

Keep event operations simple for clubs while giving college administration clear financial visibility and control.

September 2026 • Rewritten product specification

Product overview

What Pravesh is, what it replaces, and the promise it makes to a college.

Pravesh is a centralized campus event and ticketing platform for colleges where multiple clubs run workshops, competitions, fests, talks, hackathons, and other ticketed activities.

Instead of every club running its own registration form, payment process, attendee list, ticket format, and entry workflow, Pravesh provides one consistent system for the entire campus.

THE PRODUCT IN ONE PAGE

Area	What Pravesh centralizes	Why it matters
Events	Create, configure, preview, publish	Every club follows the same event workflow
Tickets	Ticket types, inventory, unique IDs, QR tokens	Students receive one consistent digital credential
Payments	Central college collection + verified status	Money stays under the college financial boundary
Check-in	QR scan, validation, duplicate detection	Fast entry without exposing unrelated attendee data
Finance	Revenue, refunds, payout requests, settlement records	Administration can reconcile event money end to end
Messaging	WhatsApp ticket link after successful payment	Students get the ticket where they are most likely to see it

THE CORE PROMISE

One campus platform for every event - with a clear separation between event operations, payment collection, and internal financial settlement.

Product thesis

The central product decision is not the event page. It is the financial boundary.

Pravesh is intentionally designed for the college environment. A club operates an event, but the college remains the central financial authority. Students pay through the official college or central payment account; Pravesh records exactly which event and organizer generated each transaction.

WHY THIS MATTERS

The platform behaves like campus infrastructure, not a marketplace that directly settles money between independent clubs and banks.

RESPONSIBILITY BOUNDARY

Role	Owns	Does not own
Student	Discovery, registration, payment, ticket, entry	Campus-wide finance or other clubs
Organizer	Event operations, ticket setup, attendee management, payout request	Direct bank transfer from the platform
Admin	Organizer approvals, campus oversight, payout review, settlement, refunds when authorized	Event operations belonging to a club

END-TO-END FINANCIAL LOGIC

The balance is derived from transaction history. A user never edits a balance value directly. Every payment, refund, payout request, approval, rejection, and settlement leaves an auditable record.

1 CENTRAL PAYMENT ACCOUNT	1 LEDGER OF TRUTH	3 PRIMARY ROLES
-------------------------------------	-----------------------------	---------------------------

Roles & permissions

Every role sees the information and actions required for its responsibility.

Student	Organizer	Admin
Discover public events	Create and manage events	Manage organizers and events
Register and pay	Define ticket types and prices	Monitor all payments
Receive ticket	Monitor registrations and revenue	Review payout requests
Present QR at entry	View attendee data	Approve / reject payouts
View own registrations	Request payouts	Record internal settlement
	Check event check-in	Issue refunds when authorized
	View payout history	Maintain campus financial oversight

ACCESS MODEL

Role-based authorization must prevent cross-club attendee and finance visibility. An organizer should only see data belonging to the organizer and its events. A student should only see their own registrations and tickets. Administration has campus-wide oversight.

RULE OF THUMB

Operational ownership follows the event. Financial authority remains with the college.

WHAT THE STUDENT EXPERIENCES

Organizer onboarding & event creation

Keep organizer setup lightweight so the club can move from approval to event creation quickly.

Because Pravesh uses a centralized college payment account, a club does not need to connect its own payment gateway for every event. The organizer provides basic club information, receives access to the organizer dashboard, and can immediately begin preparing events.

EVENT CREATION

Input	Purpose
Event title + description	Explain what the event is and why students should attend
Banner + event content	Create a consistent public event page
Date + time	Define the schedule
Venue or online meeting information	Tell attendees where to go or join
Capacity	Control the total number of registrations
Registration fields	Collect only the information the event needs
Ticket types	Define pricing, quantities, sales windows, and requirements
Draft / preview / publish	Let organizers verify the event before it becomes public

TICKET TYPES

An event can offer Early Bird, Regular, VIP, Team, Student, or other tiers. Each tier can have its own price, inventory limit, sales window, and registration requirements.

Student registration & ticketing

The public experience should feel familiar: understand the event, register, pay, and immediately get a usable ticket.

REGISTRATION RULES

- Ask only for information required by the event.
- Calculate the payment amount from the selected ticket type.
- Create the registration and ticket only after successful payment verification.
- Generate a unique ticket number and secure QR token.
- Keep attendee information behind the relevant role boundary.

TICKET RECORD

Ticket field	Purpose
Ticket number	Human-readable unique reference
QR token	Secure identifier for entry validation
Event ID	Binds the ticket to one event
Registration ID	Connects admission to the student registration
Payment status	Determines whether the ticket is valid for entry
Check-in status	Prevents reuse after entry

TICKET PRINCIPLE

The QR code should identify the ticket securely, not expose unnecessary attendee information.

WhatsApp ticket delivery

A new delivery layer for Pravesh: send the ticket where the student is most likely to notice it.

Pravesh will integrate the Meta WhatsApp Cloud API to send a registration confirmation after the payment webhook is verified and the ticket is created. The first implementation should send a secure ticket link containing the QR code.

MESSAGE CONTENT

REGISTRATION CONFIRMED

Event: Tech Fest 2026

Ticket ID: PRV-102938

Your digital ticket is ready: pravesh.in/ticket/PRV-102938

Show the QR code at the event entrance.

IMPLEMENTATION PRINCIPLES

Decision	Pravesh approach
Messaging provider	Meta WhatsApp Cloud API
When to send	Only after payment is verified and ticket creation succeeds
Ticket format for MVP	Secure ticket link + QR; PDF delivery can be added later
Credential security	Keep access token on the backend, never in the frontend
Failure handling	Record the delivery failure; keep the ticket available in the student dashboard
Access control	Use a non-guessable ticket identifier or signed token

WHY THIS FEATURE

It removes a manual step between registration and entry: the student does not need to search email, download a file, or ask an organizer for a ticket.

Payment & financial ledger

Payment confirmation is the trigger for ticket issuance, revenue attribution, and later settlement.

Every successful transaction is associated with both an event and an organizer. This makes it possible to answer, at any point, how much an event collected, how much a club generated, how much has already been settled, and what remains available.

SERVER-SIDE PAYMENT RULES

- Payment webhooks are authoritative events; the frontend is not the source of truth for payment status.
- Only a verified successful payment can move a registration into a paid state.
- The transaction record must contain the event, organizer, ticket, payment reference, amount, and status.
- Balance must be derived from immutable transaction records rather than stored as an editable number.
- Every financial state change should be auditable.

CRITICAL EDGE CASE

If the gateway confirms payment but the application fails before ticket creation, the system must safely reconcile the payment and issue the missing ticket without creating a duplicate charge or duplicate ticket.

Payout requests & settlements

Organizers request money. Administration approves and records the actual internal transfer.

WHAT THE ADMIN REVIEWS

Evidence	Why it is shown
Revenue breakdown	Verify the money generated by the organizer
Refunds / adjustments	Account for amounts that should not be settled
Previous settlements	Prevent paying the same balance twice
Requested amount	Confirm what the organizer is asking for
Remaining available balance	Keep the approval within the actual ledger

PAYOUT STATES

State	Meaning
PENDING	Organizer submitted request
REVIEW	Admin is validating the request
APPROVED	Admin confirmed the amount
PROCESSING	Transfer is being completed
PAID	Transfer recorded with settlement reference
REJECTED	Request declined with a reason

SETTLEMENT RECORD

Store organizer, amount, approval timestamp, settlement timestamp, administrator, and the bank / UTR reference supplied by the college finance process.

Check-in & entry

The entrance experience is deliberately simple: scan, validate, admit.

VALIDATION RULES

Check	Expected result
Ticket exists	Identify the registration without exposing unrelated records
Correct event	Reject tickets belonging to another event
Payment successful	Reject unpaid or invalid payment states
Not already used	Reject duplicate check-ins
Not cancelled / refunded	Reject tickets no longer valid

OPERATIONAL RESULT

VALID

Clear success state; record the entry.

INVALID

Clear failure state; explain enough for staff to resolve the issue without exposing unrelated attendee data.

A future enhancement can address offline scanning. The MVP should prioritize a reliable online validation path and an audit record for every check-in.

11 / Technology stack & core modules

A practical web-first architecture for event registration, payments, tickets, and WhatsApp delivery.

Core modules

Authentication & roles	Student, organizer, and admin access with role-based authorization.
Event management	Create, edit, publish, schedule, capacity, venue, and event content.
Ticketing & QR	Ticket types, pricing, unique ticket IDs, secure QR tokens, and validation.
Registration	Custom attendee fields, registration records, payment status, and confirmation.
Payments — Razorpay	Checkout, verified webhooks, payment reconciliation, and authorized refunds.
WhatsApp delivery	Meta WhatsApp Business Cloud API for confirmation messages and secure ticket links.
Check-in	QR scanning, payment/status validation, duplicate detection, and attendance records.
Finance & administration	Revenue ledger, payout requests, approvals, settlements, and audit history.

11 / Product architecture

The selected stack connects event operations, secure payments, tickets, and WhatsApp delivery.

System responsibilities

React Public event pages, student registration, organizer dashboard, admin console, and QR check-in interface.
NestJS Authentication, role-based authorization, event management, ticket creation, payment webhooks, and finance APIs.
PostgreSQL Users, organizers, events, tickets, registrations, payments, refunds, payouts, settlements, and audit records.
Razorpay Payment checkout and payment status confirmation through verified server-side webhooks.
Meta WhatsApp Business API Send registration confirmation and a secure ticket link after payment verification and ticket creation.

Implementation rule

Payment confirmation and ticket creation remain server-side; API secrets never reach the frontend.

Data model & operating principles

Make the relationship between event activity and money explicit.

CORE ENTITIES

Entity	Meaning
Organizer	Club identity and access information
Event	Event configuration and ownership
Registration	A student registration for an event
Payment	Gateway transaction and payment status
Ticket	Issued admission credential
Check-in	Recorded entry
Payout request	Organizer request for internal settlement
Settlement	Final administrative transfer record

OPERATING PRINCIPLES

- One payment account can serve the entire college platform.
- Every payment must be attributable to exactly one event and organizer.
- Organizer balances are derived from transaction history.
- Payouts require explicit administrative approval.
- Every financial state change creates an audit record.
- QR tickets use non-guessable identifiers or signed tokens.
- Role-based access prevents cross-club attendee and finance visibility.
- Payment webhooks are verified before marking a registration as paid.

MVP scope

Build the complete lifecycle first. Expand only after the core model works.

MVP INCLUDES

#	Capability	Definition of done
01	Authentication + roles	Student, organizer, admin access
02	Event creation	Draft, publish, ticket types, capacity, registration fields
03	Public event pages	Clear event information and registration experience
04	Payment	Central payment gateway + verified webhook confirmation
05	Digital tickets	Unique ticket number + QR code
06	WhatsApp delivery	Confirmation + secure ticket link after payment
07	Check-in	Web/mobile-friendly QR scanning and validation
08	Organizer analytics	Registrations, revenue, ticket sales, check-ins
09	Payout requests	Request, review, approve / reject, settlement history
10	Admin finance	Campus revenue, refunds, payout requests, audit trail

LATER EXPANSION

Coupons, waitlists, certificates, team registrations, sponsorships, automated refunds, WhatsApp notifications beyond ticketing, attendance analytics, multiple payment providers, and marketplace-style organizer settlements can come later. They are not required to validate the core Pravesh model.

BUILD ORDER

1. Event lifecycle → 2. payment + ticket → 3. WhatsApp delivery → 4. check-in → 5. finance + settlements → 6. analytics and expansion.

Product summary

The one-page explanation you should be able to say in an interview.

PRAVESH IN ONE SENTENCE

A centralized campus event infrastructure layer that lets clubs publish events and manage tickets while giving students a fast registration experience and giving college administration one source of truth for payments, settlements, and entry records.

THE COMPLETE JOURNEY

WHAT MAKES THE PRODUCT COHERENT

Decision	Result
Centralized event operations	Every club follows one consistent workflow
Central payment account	The college retains financial control
Ledger-first finance	Balances can be explained and audited
Secure QR tickets	Entry is fast and reusable tickets are rejected
WhatsApp delivery	Students receive the ticket immediately after payment
Role-based access	Clubs only see their own operational data
Explicit settlement	Every payout ends with a recorded internal transfer

FINAL PRODUCT STATEMENT

Events. Tickets. Entry. Settlement.

Pravesh is not just a registration form with a QR code. It is a campus-wide operating layer connecting event creation, payment, ticket delivery, entry, revenue attribution, and internal settlement in one auditable system.
